

Argos Bot CTS Bridge API

Circle marketplace submission - endpoint reference and complete OpenAPI specification.

Discover ownerless Arc and Base token connections through Circle's Crosschain Token Standard (CTS), CrossChainTokenService and Cross-Chain Transfer Protocol (CCTP). Prepare registration, wrapper creation and transfers in either direction. External wallets sign and broadcast all blockchain transactions.

Service: <https://bridge-api.argosbot.io>

Live specification: <https://bridge-api.argosbot.io/openapi.json>

Documentation: <https://bridge-api.argosbot.io/lms.txt>

11 documented API operations, including 4 paid entry points. Job follow-up calls are included in the job price. Documentation and health resources are not counted.

GET /v1/lookup

0.005 USDC

POST /v1/authorization

No additional API charge

POST /v1/jobs

0.010 USDC

GET /v1/jobs/{id}

No additional API charge

POST /v1/jobs/{id}/next

No additional API charge

POST /v1/jobs/{id}/arm

No additional API charge

POST /v1/jobs/{id}/renew

No additional API charge

POST /v1/jobs/{id}/transactions

No additional API charge

POST /v1/jobs/{id}/resume

No additional API charge

GET /v1/lookup/direct

0.007 USDC

POST /v1/jobs/direct

0.012 USDC

Payment model and integration

Pay per request in USDC through x402. Standard lookup and job endpoints accept Arc Circle Gateway or Base direct USDC. The /direct alternatives accept direct USDC on Arc or Base. Payment network is independent of token source chain.

Network gas and Circle forwarding fees are separate from API fees. A missing bridge is a valid lookup result. A job covers subsequent preparation, status and recovery requests.

Lookup input: token contract address, with optional chain selection. Addresses are request parameters, not a fixed token selection. The API is not limited to ARGUS.

Job creation requires an explicit intent and external EOA authorization obtained from POST /v1/authorization. Job access then uses the returned bearer capability. Transactions must be reviewed, signed and broadcast by the external wallet. Arc and Base use the same EOA as sender and recipient.

The API supports ownerless connections. Wrapper creation does not certify original-token behavior. Known incompatibilities, failed simulations and insufficient gas block preparation. This is an independent service, not a claim of Circle endorsement.

The following appendix reproduces the public OpenAPI JSON retrieved on 27 September 2026. Visual line wrapping does not change the specification. Use the live JSON URL for machine ingestion.

  "info": {
    "title": "Argos Bot CTS Bridge API",
    "version": "1.0.0",
    "description": "Inspect ownerless Arc/Base connections and coordinate external-wallet registration, wrapper creation and transfers through Circle's Crosschain Token Standard (CTS), CrossChainTokenService and CCTP. Wallets sign their own transactions.",
    "x-guidance": "Argos Bot CTS Bridge API\nIndependent external-wallet API for ownerless Arc (5042) and Base (8453) token connections through Circle CTS, CrossChainTokenService and CCTP.\n1. GET /v1/lookup?token=0x...&chain=arc|base. Missing registration is a valid paid result. A token address alone cannot prove its chain.\n2. POST /v1/authorization with a JobIntent. Sign its typedData with the external EOA that holds the tokens. Preserve the intent and expiresAt exactly.\n3. POST /v1/jobs with intent, expiresAt, signature. The standard endpoint accepts Circle Gateway USDC on Arc or direct USDC on Base. Alternatively use POST /v1/jobs/direct for direct USDC on Arc or Base. Pay only an option offered by the current challenge; never switch endpoints or rails while a payment is unresolved. Retry the identical body with the same Payment-Signature. Preserve returned job.id and accessToken. Never replace an uncertain payment.\n4. Use Authorization: Bearer accessToken for all job endpoints. POST /v1/jobs/{id}/next returns a quote. Check route, step, fees and chain. POST /arm with stepId immediately before signing. Only arm returns the signable transaction and its deadline.\n5. Sign and broadcast that exact transaction with your own wallet. Do not sign expired plans. Persist the signed transaction/hash locally before broadcast. POST /transactions with stepId and hash. On timeout, recover the same wallet transaction; do not create another transfer.\n6. POST /resume refreshes receipts; GET the job to read saved progress. After registration, approval or deployment is complete, call /next again. Repeat until job.state is complete. Delivered means observed on destination but not yet finalized. Waiting for finality can take roughly 20 minutes on Base and is not a failure.\n7. To return tokens, create a NEW job using the wrapped address and its current source chain. Destination is always the same EOA on the other chain. Setup requires allowSetup=true; mode=setup creates a connection without transferring tokens. Existing approved setup is reused.\nStandard lookup costs 0.005 USDC and a job costs 0.01 USDC. The /direct alternatives cost 0.007 and 0.012 USDC respectively. A job includes subsequent preparation, status and recovery requests. The payment network is independent of the token source chain. Network gas and Circle forwarding fees are separate and use source native units (18 decimals: Arc USDC or Base ETH). Fee caps are per transaction. Source tokens use their own decimals. Base ETH is needed for transactions originating on Base, including return/unwrap.\nOnly Arc/Base external EOAs are supported. Known incompatible tokens, wrong contract identities, pauses, failed simulations and insufficient gas are blocked. Wrapper creation does not certify transfer behavior or guarantee liquidity. This API never receives private keys, signs transactions or exposes operator wallets.\nArmed or submitted steps are never automatically discarded. If a wallet request was interrupted, provide its hash. A finalized same-nonce replacement can terminate the job. Preserve recovery data; never assume a missing receipt means no transaction occurred.\nIf an armed quote expires before broadcast, POST /renew with stepId to obtain a fresh quote at the SAME nonce. First reconcile any transaction your wallet already broadcast. A quoted, unarmed step can be refreshed using /next. Neither endpoint broadcasts anything.\nOpenAPI: https://bridge-api.argosbot.io/openapi.json\nFor an uncertain direct USDC payment, retry the identical paid request with its original Payment-Signature and a Payment-Transaction header containing the settlement transaction hash from the facilitator. Recovery requires finalized canonical USDC receipt and exact authorization evidence. It never submits payment again. Missing evidence, unsupported batched calls or an unknown hash leave the payment unresolved; do not pay again. Gateway reconciliation does not need this header.\nThis service is independent of Circle. Marketplace listing requires separate review; this document is not an endorsement.\n",
